Roland Kajatin

Systems & Full-Stack Engineer

Website GitHub LinkedIn roland.kajatin@gmail.com +45 20 73 00 65

Systems and full-stack engineer with deep experience building edge-connected, low-latency software for production hardware fleets. Started as a C++/CUDA developer on NVIDIA Jetson, built a Rust-based fleet agent and MQTT messaging pipeline at scale, led the AWS backend and observability stack supporting 2000+ IoT devices, and shipped multi-platform mobile applications. Comfortable across the stack: from on-device daemons to PostgreSQL on RDS to React Native apps, with a bias for systems that are simple to reason about under pressure.

Technologies PostgreSQL · AWS · Typescript · C++ · Rust · React Native · Expo · React · Next.js · Storybook · Python MQTT · Docker · Github Actions · Linux · Grafana · VictoriaMetrics · Prometheus · Svelte

Experience

Teton

Lead Software Engineer

2023 — Present

Owned end-to-end delivery of patient-monitoring product features across edge, backend, mobile, and web — including the AWS backend services handling messages from a fleet of 2000+ IoT devices in clinical settings.

Designed and operated AWS-hosted backend services with PostgreSQL on RDS, hardening the MQTT ingestion pipeline against ill-behaved clients and partial failures.

Built and configured the observability stack on Grafana, VictoriaMetrics, and Prometheus: dashboards, alerts, and on-call runbooks that the team relies on to catch regressions before customers do.

Led production reliability and on-call practices: incident response, postmortems, and deployment flow for both applications and cloud services.

Led feature development and on-device application deployments for a growing computer vision team operating on Jetson hardware.

Implemented GitHub Actions CI/CD for backend deploys, edge releases, and PR status checks; built internal tools for deployment workflows and data pipelines.

Architected and shipped cross-platform product features in React Native and TypeScript — keeping a foot in product while owning the systems underneath.

Teton

Computer Vision Engineer

2020 — 2023

Built modular, high-performance edge applications in C++, CUDA, and TensorRT on NVIDIA Jetson — running real-time computer vision under hard latency budgets in production hospital environments.

Designed and built a custom fleet management agent in Rust, handling device lifecycle, remote configuration, and health reporting across the device fleet.

Built and maintained the MQTT messaging pipeline end-to-end. On-device publishers, broker integration, and backend consumers — with attention to connection lifecycle, reconnect behavior, and message durability.

Supported ML deployment workflows and production performance tuning, profiling on-device pipelines for throughput and latency.

Automated flashing and provisioning of Jetson devices to make fleet onboarding repeatable and recoverable.

Collaborated directly with medical professionals to iterate on the system based on real-world clinical use.

Alstom Transport Denmark A/S

Test Analyst

2018 — 2020

Conducted functional and stress testing on national traffic management system for rail operations software.

Developed desktop utilities using .NET/C# for RFID and device provisioning used by trackside operators.

Supported deployment and automation of handheld and embedded devices in the field.

Technical University of Denmark

IT Employee

June — August 2020

Integrated Intel RealSense cameras into a modular robotics platform.

Implemented resectioning and stereo vision calibration tools using OpenCV, in collaboration with engineers at Robot At Work.

Education

Technical University of Denmark

MSc in Engineering (Autonomous Systems)

2018 — 2020

Thesis Computer Vision System for Autonomous Mortar Raking Robots

Aalborg University (Denmark)

BSc in Engineering (Robotics)

2015 — 2018

Thesis Obstacle Avoidance with VFH+ on the DJI Matrice 100 Quadcopter Using Stereo Vision
